

SCALA-LOGGING WITH LOG4J2

HENRIETTE HARMSE

In this brief post I provide a minimal complete example that uses `scala-logging` with `log4j2`. `scala-logging` is a Scala logging library wrapping SLF4J. When I tried to setup this up myself, I could not find an example with the correct dependencies that works for `scala-logging` using `log4j2`.

1. SCALA CODE

Here is a minimal complete Scala code example using `scala-logging`. Note that we use a companion object to define an instance of `Logger` that will be shared across all instances of `SimpleLoggingTest`.

```
package org.henrietteharmse.tutorial

import com.typesafe.scalalogging.Logger

class SimpleLoggingTest {
  SimpleLoggingTest.logger.trace("Hello while instance of SimpleLoggingTest is created.")
}

object SimpleLoggingTest {
  private val logger = Logger[SimpleLoggingTest]

  def main(args: Array[String]): Unit = {
    logger.trace("Hello from SimpleLoggingTest companion object")
    val simpleLoggingTest = new SimpleLoggingTest
    try {
      throw new RuntimeException("Some error")
    } catch {
      case t: Throwable => logger.error(s"Error: ${t.getMessage}")
    }
  }
}
```

2. LOG4J CONFIGURATION

In this section we provide a minimal `log4j.xml` configuration file. It defines a trace level logger for our application code with an error level logger for all other errors. Logging for our code will be written to a file in `./logs/App.log`, and all errors, originating from other code than our own code, being logged to the console.

```
<?xml version="1.0" encoding="UTF-8"?>
<Configuration status="WARN">
  <Appenders>
    <Console name="Console" target="SYSTEM_OUT">
      <PatternLayout pattern="%markerSimpleName %-5p %C.%M():%L - %msg %ex{full}%n"/>
    </Console>
  </Appenders>
</Configuration>
```

Date: 8th June 2020.

```

</Console>
<File name="Log" fileName="./logs/App.log">
  <PatternLayout>
    <Pattern>%markerSimpleName %-5p %C.%M():%L - %msg %ex{full}%n</Pattern>
  </PatternLayout>
</File>
</Appenders>
<Loggers>
  <Logger name="org.henrietteharmse.tutorial" level="trace" additivity="false">
    <AppenderRef ref="Log"/>
  </Logger>
  <Root level="error">
    <AppenderRef ref="Console"/>
  </Root>
</Loggers>
</Configuration>

```

3. SBT CONFIGURATION

The `build.sbt` file for building this application is given below. Most importantly it states the correct dependencies for using `scala-logging` with the `libraryDependencies` setting. To get debug information from `log4j`, we set the system property `log4j2.debug` to `true`.

```

ThisBuild / scalaVersion := "2.13.2"
ThisBuild / organization := "org.henrietteharmse.tutorial"

val setLog4jDebug = sys.props("log4j2.debug") = "true"

lazy val root = (project in file("."))
  .settings(
    name := "scala-logging-with-log4j2",
    libraryDependencies ++= Seq(
      "com.typesafe.scala-logging" %% "scala-logging" % "3.9.2",
      "org.slf4j" % "slf4j-api" % "1.7.30",
      "org.apache.logging.log4j" % "log4j-slf4j-impl" % "2.13.3"
    ),
    scalacOptions ++= Seq("-deprecation")
  )

```

4. CONCLUSION

This post gives a minimal complete example for using `scala-logging` with `log4j` using SBT. The complete code example can be found here on [GitHub](#).
